CS 290
Project

For my website project I have decided to make a portfolio web page to showcase my resume, projects, and personal interests. This webpage will be the platform I build upon in the future to show my improved web development skills and to track my own progress as a computer programmer.

The basic layout of my home page that I'm looking to model:

The home page has all the basic building blocks for the separate pages I will need to make and is a useful way to introduce what the web page is about, which in this case, is about myself and my programming projects / skills.

Some changes I plan on making to the home page is adding the image carousel centrally where the image of the individual is on the above page (see below for an example of the carousel). The carousel will have an image of myself, some stock image of code and possibly a picture of myself writing code. The navigation bar will also be changed to have three links (Home, Projects, and a Personal interests page).

For the Projects page I plan on adding pictures of some of the 3D rendering I made using a python script and couple of other images of some finished projects and a link to my GitHub page. I also plan on adding some interactivity to this page to demonstrate some javascript comprehension which satisfies one of the requirements for this project. I plan on keeping the same color them on each page as well as centering all the content for each page.

The personal interests page will be where I embed a few videos of some things I find interesting (rock climbing, fitness, and food). I will also add a small paragraph about why these things interest me.

Below are mock ups for each of my pages:
